

Rhodes Orchid Odyssey

Holiday Report 7-14 April 2018 Led by Yiannis Christofides & Jon Dunn

Greenwings Wildlife Holidays

Tel: 01473 254658 Web: www.greenwings.co.uk Email: enquiries@greenwings.co.uk

Introduction

The island of Rhodes is part of the south-eastern Aegean Island complex known as the Dodecanese, and is situated just 18km from the south-west coast of Turkey. With over 300 days of sunshine a year, it's no surprise that it is a popular destination for tourists, who flock to the island for its sunny beaches or perhaps to visit its ancient and medieval ruins, of which there are plenty. However, its location and geology of schist and limestone means it is also blessed with a wonderful mixture of Mediterranean and Asiatic flora and fauna.

Away from the town of Rhodes one can find miles of unspoilt countryside full of wildlife. It has three mountains, the highest of these being Mt. Attaviros which rises to 1,215 m, followed by Mt. Profitis Ilias and Mt. Akramites. For orchids it is one of the best Greek islands, with a large list of diverse and interesting species, particularly in the genus Ophrys. The island also has an impressive plant list of around 1,500 known species in total.

The orchids would be our main focus during the holiday and as we would explore the central and southern areas of the island, we based ourselves in two different locations, with 5 days in the south centre and the rest based on Mt. Proitis Ilias. This gave us a chance to make leisurely forays into the mountains, river valleys, forests, coastal and olive grove habitats. Our hope was to see around 30-40 species of orchids, together with some other very interesting flora and fauna.

The guests joining us were Alfred, Anthony, Robin, Roger, Judy, Celia, Iain, Lynne, Philip, Jennifer and Diane. The holiday was led by Yiannis Christofides and Jon Dunn. Yiannis is a respected botanical author and excellent all round naturalist. He has recently published a new *Illustrated Flora of Cyprus* and is currently working on a book of plants of the Eastern Mediterranean. Jon is an experienced guide, all round naturalist and author of several books, his most recent being *Orchid Summer*.

The following is an outline of the week with a daily diary, followed by a gallery and species lists.

Day 1.

Arrival at Diagoras airport. Robin, Roger and Yiannis arrived earlier from Crete and Cyprus respectively and were picked up by Matt. The main group with Jon Dunn arrived at 1 pm. We picked up our mini-buses and drove to our destination in Embonas. The hotel prepared a simple lunch with greek salad and a few other things and then we went for a walk up the hill. Despite the dry winter the area was full of flowers and some orchids too. We saw *Muscari comosum*, *Vicia hybrida*, *Vicia villosa* and *Ophrys candica*.

Day 2.

The weather did not look promising as we headed due south. This is the drier part of the island and we wanted to visit as soon as possible to see what orchids we could found. Our first stop was at the gorge at to see the endemic *Campanula hagiela* and *Centaurea lactuciflora* growing on the walls of the gorge. We then continued due south and turned off on a track near Kattavia. *Anacamptis fragrans* was out in force but the early orchids had finished flowering. We also saw many of the common garique plants such as *Satureja thymbra*, *Helichrysum stoechas*, *Phagnalon rupestre*, *Pistacia lentiscus* and others.

By now rain and thunder were threatening so we boarded our mini-buses and continued due east. We stopped at the little church to check on the *Ophrys cretica ssp belonae* but found only one plant with the last flower out. As it was now raining heavily we thought our best course of action was to go down to Prasonisi for coffee, and we were lucky to find the only cafe open. By now the rain had eased and we made a stop to check a slope out. It had beautiful clumps of *Anacamptis pyramidalis* and *Anacamptis fragrans* in good flower and then we started to find other things too. *Ophrys regis-ferdinardii* was around with the last of the flowers still in good order. *Fritillaria rhodia* was also still in flower and several plants were seen. *Lithodora hispidula* was common on the slopes as well as *Euphorbia acanthothamnos* and *Genista acanthoclados*. A surprise was to find several individuals of *Ophrys calypsus* and a single specimen of *Ophrys iricolor*. After we had explored the hillside thoroughly we started on the return journey stopping at a beach were we saw *Ononis hispanica*, *Rumex bucephalophorus*, *Juniperus oxycedrus ssp. macrocarpa* and *Campanula rhodensis*. A pair of mating *Empusa fasciata* kept the photographers busy.

We returned rather later than we intended to a superb meal of typical greek starters and meat on the grill, finishing off with a nice desert.

Day 3.

The storms that hit the island yesterday finally moved off and the day started partly clouded but improved considerably as the day moved on.

We set out to visit a mountain top in southern Rhodes so we started driving due south before turning inland. A small bird caused us to pause and we took the opportunity for a little exploration by the roadside, finding Eastern Dappled White, another species of mantis, Green-underside blue and a few new plants.

We soon picked up the dirt track that led us to the top, but not before some orchids were spotted from the van. We found *Ophrys reinholdii* and *Ophrys bombyliflora*. We then moved on up to the top of the hill and started exploring. *Orchis anatolica* was very common and there were still a few plants in good flower. We also started finding some *Ophrys* and we saw good numbers of *Ophrys polyxo*, *Ophrys parvula* and a few of *Ophrys omegaifera* and one *Ophrys ataviria*. We searched for

Ophrys tenthredinifera, seen there last year but none were to be found. Astragalus austroaegaeus and Astragalus spruneri were there in good flower. A Green Toad Bufo viridis was found and well photographed.

As it was getting late we started on the return journey, stopping to meet Matt who had some treats in store for us. We also took the opportunity to explore further, finding many *Anacamptis fragrans* in a variety of colours, one *A. sancta* and a couple of hybrids between the two. A highlight of the day was also the Bonelli's Eagle which was observed well for a few minutes. We returned home to another excellent meal.

Day 4.

Our destination today was the east coast where we were hoping to see several new species. We headed for Agios Isidoros and then down the winding road to the coast. Our first stop was by the river, where we started exploring the olive groves. We soon found *Ophrys colossaea* in excellent shape and in good numbers. Other orchids were present as well, such as *Serapias parviflora* and *S. bergonii*. As we were exploring we heard the call of Golden Oriole and a little later of Corncrake. Despite searching we failed to get a sighting, but instead enjoyed good views of Crested Larks dust-bathing and feeding beside the track. *Ornithogalum narbonense* was growing by the side of the track.

We then moved down to the beach where we saw *Alkanna tinctoria*, *Alyssum sibiricum*, *Medicago marina* and other plants of this habitat. After lunch we explored another nearby location finding *O. calypsus*.

Our next destination was due south from here and after a stop for refreshments we started to explore some other olive groves, finding *Serapias carica* and a little later lots of *O. ataviria* and *O. blitopertha* in good numbers. When everybody had taken their photographs we started on the return journey. On the way we had several sightings of the Rhodian deer.

We stopped just before the village to look for *Ornithogalum nutans* which we had seen there on a previous visit but found the plants in seed. We were rewarded by masses of beautiful *Muscari comosum* and the amazing flowers of *Aristolochia guichardii* and, nearby, *Ophrys ferrum-equinum* and *O.rhodia*.

Day 5.

Today was the day we exchanged hotels, swapping our base for the higher, more easterly elevations of Profitis Ilias. Before we left the area, however, we explored the length of the Attaviros road, stopping frequently on its slopes to hunt for orchids. A small meadow at the foot of the hill got us off to a good start, holding a number of *Anacamptis pyramidalis* and

Ophrys candica, O. reinholdii and O.s icula, but it was the roadside itself that yielded the most impressive display of O. reinholdii, with several dozen plants noted including some particularly impressive flowers in pristine, velvety condition. Nearby were a few examples of Cyclamen rhodium; further uphill we found many more plants in impressive display, together with a number of O. omegaifera and a single O. attaviria.

A short further drive was interrupted when sharp eyes spotted something intriguing from the moving vehicle – the pale purple spires of *Limodorum abortivum* rising from the woodland floor near the road. Naturally, we stopped for these and, to our delight, found dozens of further plants in every state from tight bud to full bloom in the woods all around us.

The tarmac eventually petered out and we carefully continued to make our way uphill on gravel tracks, stopping periodically before reaching the hilltop site at which we'd have our picnic lunch. Here we found many *Orchis anatolica* amongst the low vegetation and then Alfie, ever alert, spotted our first *Anacamptis papilionacae* in full bloom – in due course we found further examples dotted around the area. Our picnic was a pleasant one with all of these orchid distractions and all to the soundtrack of Woodlarks singing around us.

The afternoon saw us arriving, many switchback corners later, high upon Profitis Ilias. We wasted no time and set about searching a previously fruitful area of sloping forest floor, fanning out to see what we could find. New orchids here were two examples of *Ophrys oreas*, some *O. dodekanensis* candidates that provoked some good-natured debate, a late and still recognisably flowering *Neotinea maculata*, and what was to prove to be our only *Orchis anthropophora* of the week, spotted by Diane as we were making our way back to the vehicles.

We searched nearby for flowering *Paeonia clusii ssp. rhodia*, initially with just limited success – a rather tired example on an overhead crag. It seemed as if the many plants around us had all finished flowering already. Jon's binoculars were pressed into flower-hunting rather than birding and, happily, he found a Rhodian peony in pristine condition in a cool, shady valley below us. We walked down to finish the day with this beautiful endemic, with the added bonus of a roosting Eastern Festoon spotted nearby by Yiannis.

Day 6.

In the morning we made our way through the pine woods that flank Profitis Ilias and the surrounding countryside towards the large freshwater body of Limni Fragmatos Gadoura. Today

promised to be a particularly hot, sunny one and we were glad of the first two stops we made, looking for orchids beneath the shade afforded by the pines. Our first stop of the morning yielded just one new species, but a very elegant and attractive one indeed – the rich cerise forms of *Ophrys mammosa*, present in small numbers here – while the second stop of the morning, exploring the woods that flanked the Gadoura river, was to a soundtrack of croaking Karpathos Frogs *Pelophylax cerigensis* from the riverside margins. Our target here were the beautiful, scarce, pink variation of the purple *Limodorum abortivum* we'd enjoyed the previous day, known as var.*rubrum*. Sure enough, we found a number of these rose-coloured beauties amongst their violet counterparts.

One final roadside stop yielded an *Orchis italica* in reasonable condition, albeit somewhat going over – other nearby plants had already finished flowering. A walk into the nearby countryside was punctuated with similarly late-stage *Ophrys candica* and *O.regis-ferdinandii*.

A short drive brought us to the shores of Limni Fragmatos Gadoura, where our arrival was heralded by a burst of birdlife – not least a flock of some 30 glorious Bee-eaters that flew overhead and then proceeded to hawk insects over the nearby water. At times these rainbow birds were even dropping into the water, presumably to drink. Further sightings included a Honey Buzzard heading purposefully north overhead, and wonderful views of Red-rumped Swallows and Little Egrets. We searched the surrounding area for plants of interest – the serpentine gravel was rendered pink in places by *Sedum eriocarpum*; we also found *Silene salamandra* here, and neat green mounds of *Anthemis rhodensis* though, sadly, none yet in flower. Our picnic lunch in these pleasant surroundings was enlivened by a wonderfully showy Scarce Swallowtail that obliged us all by posing for photos.

Our return to the hotel was via a leisurely stop in a small roadside meadow and grove that sports a colony of *Anacamptis laxiflora*. These statuesque orchids were a treat in themselves, and shared their site with subtle *Ophrys bombyliflora*, but a further treat was in store for us all as Matt came to join us with two boxes of delicious sweet pastries from his local bakers. Orchid-hunting was, eventually, forgotten for a while as we sat and indulged in this unexpected treat.

Day 7.

Celia and Iain had been exploring uphill from our hotel the previous evening before dinner, and their discovery of a small colony of *Anacamptis picta* meant our first excursion of our final full day in Rhodes was to see these flowers — we took a while to examine them and appreciate the subtle differences that differentiate them from the *A. morio* with which we're all familiar back home in the UK and, as our attention wandered, we found more *Ophrys rhodia*, *O. sicula*, and *Orchis anatolica* in the surrounding rocky landscape, as well as a sea of scarlet poppies at our feet. The views from this mountain top were spectacular, and we were able to plot our steps in previous days from this vantage point while curious goats with clanking bells scrambled across the rocks to see what we were finding so interesting.

We wended a slow way downhill, checking the roadside for more orchids, finding initially only *Anacamptis pyramidalis* – those curious goats had, perhaps, been here before us... A wooded, more level area meanwhile was more fruitful – here we found *Ophrys rheinholdii*, *O. polyxo*, and *O. sicula* while, for further interest, we also saw elusive Snake-eyed Skink and, in the open areas, Small Copper and Eastern Festoon on the wing.

We returned at this point to the orchid-rich hillside we'd visited on our arrival on Profitis Ilias two days previously to search a little more in this promising habitat and, for some of the group, for second-helpings of the *Ophrys oreas*. Further close scrutiny of this area turned up new *O. ferrumequinum* and variably patterned *O.polyxo* and then, thanks to Robin's sharp eyes, a final *O. attaviria*. We ate lunch here too, a meal enlivened by a curious Oertzeni's Rock Lizard

Anatololacerta oertzeni that scrambled up and down a nearby tree to keep a watchful eye upon us.

The afternoon was punctuated by leisurely stops, firstly at a nearby small, white-painted church and then in the surrounding wooded countryside, yielding final sightings of *Ophrys candica* and *Limodorum abortivum* in full bloom, and several more Eastern Festoons making the most of another sunny day — they were extremely active and, for the most part, unapproachable for photographs...

...however, this was not to prove a problem as, that evening, on our way to a delicious dinner in a local taverna, we made one final stop at a location Yiannis had kept up his sleeve for the final day — a roost site for these gorgeous butterflies. We found several individuals settled down for the evening, roosting together on dead, stiff vegetation and, in the cool evening light, they made for incredibly obliging photographic subjects. A final orchidaceous flourish came with the discovery nearby of unequivocal examples of *Ophrys dodekanensis*, leaving everyone happy with their identification and all set for our last supper together.

Day 8. Return to the UK

All good things, sadly, have to come to an end, and so it was on our final morning on Rhodes. As a group we were all on fine form, finding wildlife of interest to the very last moment — *Ophrys sicula* and an Egyptian Locust even as we were loading the vehicles to bid our goodbyes to the hotel! Our journey to the airport was smooth and uneventful, and broken with an hour-long chance to explore the ancient ruins at Kamiros where, looking across the azure channel that separates Rhodes from nearby Turkey, we laid plans to return another year for more orchid-hunting adventures...

Acknowledgements: Greenwings would like to thank all their guests on this trip for their wonderful support, good humour and enthusiasm throughout the holiday, for their help in compiling species lists and for the use of their photographs. Special thanks must also go to Yiannis Christofides and Jon Dunn for their unbounded enthusiasm in every aspect of the botany, and for compiling the species lists and editing the report.
